

AI ASSISTED CODING

ASSIGNMENT-5.1 AND 6

NAME: Harshitha Guda

H.T.No.:2303A51102

Task 1:

Employee Data: Create Python code that defines a class named `Employee` with the following attributes: `empid`, `empname`, `designation`, `basic_salary`, and `exp`. Implement a method `display_details()` to print all employee details. Implement another method `calculate_allowance()` to determine additional allowance based on experience:

- If `exp > 10 years` → allowance = 20% of `basic_salary`
- If `5 ≤ exp ≤ 10 years` → allowance = 10% of `basic_salary`
- If `exp < 5 years` → allowance = 5% of `basic_salary`

Finally, create at least one instance of the `Employee` class, call the `display_details()` method, and print the calculated allowance.

```
1  class Employee:  
2      def __init__(self,empid, empname, designation,basic_salary,exp):  
3          self.empid = empid  
4          self.empname = empname  
5          self.designation = designation  
6          self.basic_salary = basic_salary  
7          self.exp = exp  
8      def display_details(self):  
9          print(f"Employee ID: {self.empid}")  
10         print(f"Employee Name: {self.empname}")  
11         print(f"Designation: {self.designation}")  
12         print(f"Basic Salary: {self.basic_salary}")  
13         print(f"Experience: {self.exp} years")  
14     def calculate_allowance(self):  
15         if self.exp >10:  
16             allowance = 0.20* self.basic_salary  
17         elif 5<= self.exp <=10:  
18             allowance = 0.10* self.basic_salary  
19         elif self.exp <5:  
20             allowance = 0.05* self.basic_salary  
21         return allowance  
22 emp=Employee(1102, "Rita", "Software Engineer", 80000, 9)  
23 emp.display_details()  
24 allowance = emp.calculate_allowance()  
25 print(f"Allowance: {allowance}")
```
